PERIODIC SOLENOIDS

Figure 3.2. Schematic of magnet sets producing a periodic focusing solenoidal field with axial periodicity length S . In Fig. 3.2 (a), successive coils are spaced by S and have the same current polarity $+I_1, +I_1, \dots$. In Fig. 3.2 (b), successive coils are spaced by $S/2$ and have alternating current polarities $+I_1, -I_1, +I_1, \dots$.

IN HIGH ENERGY
ACCELERATORS"

1.1 Radial envelope equation

$$\tilde{r}'' + \frac{(\gamma\beta)'}{(\gamma\beta)}\tilde{r}' + \left(\frac{\gamma''}{2\gamma\beta^2}\right)\tilde{r} + \left(\frac{\omega_c}{2\gamma\beta c}\right)^2\tilde{r} - \left(\frac{\langle p_\theta \rangle}{\gamma m\beta c}\right)^2\frac{1}{\tilde{r}^3} - \frac{\varepsilon_r^2}{\tilde{r}^3} - \frac{Q}{2\tilde{r}} = 0 \quad (1)$$

$$p_\theta \equiv \gamma m r^2 \dot{\theta} + q r A_\theta, \quad (2)$$

$$\varepsilon_r \equiv \sqrt{\langle r^2 \rangle \langle r'^2 \rangle - \langle r r' \rangle^2 + \langle r^2 \rangle \langle r^2 \theta'^2 \rangle - \langle r^2 \theta' \rangle^2} \quad (3)$$

$$Q \equiv \frac{1}{mc^2 \beta^2 \gamma^3} \frac{q \langle \lambda(r) \rangle}{2\pi \epsilon_0} \quad (4)$$

1.2 Beam current limit in long solenoid

- Long solenoid: $\mathbf{B} = B_z \hat{z}$.
- No acceleration $\gamma' = \gamma'' = 0$.
- Set $p_\theta = 0$ and $\epsilon_r = 0$ to minimizing “repelling” forces.

$$\tilde{r}'' + \left(\frac{\omega_c}{2\gamma\beta c} \right)^2 \tilde{r} - \frac{Q}{2\tilde{r}} = 0 \quad (5)$$

Maximum beam perveance occurs at equilibrium, when $\tilde{r}' = \tilde{r}'' = 0$:

$$Q = \frac{1}{2} \left(\frac{\omega_c \tilde{r}}{\gamma\beta c} \right)^2 \quad (6)$$

1.3 Derivation from force balance at low energies

- Particle moves with angular velocity $\theta = \omega r$.
- Particle sees linear focusing force from solenoid field $B_z = \omega_c m/q$.
- Within beam envelope, particle sees linear defocusing force from space charge.

$$\underbrace{m\omega^2 r}_{\text{centrifugal}} + \underbrace{\frac{Qm\beta^2 c^2}{2\tilde{r}^2} r}_{\text{centrifugal}} = \underbrace{qv_\theta B_z}_{\text{magnetic}} \quad (7)$$

$$\omega^2 r + \frac{Q\beta^2 c^2}{2\tilde{r}^2} r = \omega_c \omega r \quad (8)$$

$$Q(\omega) = \frac{2\tilde{r}^2}{\beta^2 c^2} (\omega\omega_c - \omega^2) \quad (9)$$

$$\omega^* = \max_{\omega} Q(\omega) = \frac{\omega_c}{2} \quad (10)$$

$$Q(\omega^*) = \frac{1}{2} \left(\frac{\omega_c \tilde{r}}{\beta c} \right)^2 \quad (11)$$

Equivalent to result from envelope equations when $\gamma^2 \rightarrow 1$:

$$Q = \frac{1}{2} \left(\frac{\omega_c \tilde{r}}{\gamma \beta c} \right)^2 \quad (12)$$

1.4 Angular kick at solenoid entrance

Approximate solenoid field as step function:

$$B_z(z) = B_0 [\Theta(z) + \Theta(L - z) - 1] = \begin{cases} 0 & \text{if } z < 0 \\ B_0 & \text{if } 0 \leq z \leq L \\ 0 & \text{if } z > L \end{cases} \quad (13)$$

$$\frac{\partial B_z}{\partial z} = B_0 [\delta(z) - \delta(L - z)] \quad (14)$$

Use earlier result to relate longitudinal derivative to radial magnetic field:

$$B_r(r, z) \approx -\frac{r}{2} \frac{\partial B_z}{\partial z} = \frac{rB_0}{2} [\delta(z) - \delta(L - z)] \quad (15)$$

Compute change in θ component of momentum at $z = \epsilon$, just after solenoid entrance:

$$\frac{d}{dt} p_\theta^*(r) = qv_z B_r \quad (16)$$

$$\Delta p_\theta^*(r) = q \int_{-\infty}^{\epsilon} B_r(r, z) dz \quad (17)$$

$$= \frac{qrB_0}{2} \int_{-\infty}^{\epsilon} [\delta(z) - \delta(L - z)] dz \quad (18)$$

$$= \frac{qrB_0}{2} \quad (19)$$

$$v_\theta = \frac{rqB_0}{2m} = \frac{r\omega_c}{2} \quad (20)$$

1.5 Beam current limits in periodic Einzel lens

Ignore centrifugal term, emittance term, and solenoid term in radial envelope equation.

$$\tilde{r}'' + \frac{\gamma'}{\gamma\beta^2}\tilde{r}' + \frac{\gamma''}{2\gamma\beta^2} - \frac{Q}{2\tilde{r}} = 0 \quad (21)$$

Assume non-relativistic beam: $\beta \ll 1$, $\gamma \approx 1$:

$$\gamma' = \beta\beta'\gamma^3 \approx \beta\beta' \quad (22)$$

$$\gamma'' \approx \beta'\beta' + \beta\beta'' \quad (23)$$

$$\tilde{r}'' + \frac{\beta'}{\beta}\tilde{r}' + \frac{1}{2} \left[\frac{\beta'^2}{\beta^2} + \frac{\beta''}{\beta} \right] \tilde{r} - \frac{Q}{2\tilde{r}} = 0 \quad (24)$$

Define new variable $R = \sqrt{\beta/\beta_0}\tilde{r}$, where β_0 is the initial velocity.

$$\tilde{r}' = \left(\frac{\beta}{\beta_0}\right)^{-1/2} R' - \frac{1}{2} \left(\frac{\beta}{\beta_0}\right)^{-3/2} \left(\frac{\beta'}{\beta}\right) R \quad (25)$$

$$\tilde{r}'' = \left(\frac{\beta}{\beta_0}\right)^{-1/2} R'' - \left(\frac{\beta}{\beta_0}\right)^{-3/2} \left(\frac{\beta'}{\beta_0}\right) R' + \frac{3}{4} \left(\frac{\beta}{\beta_0}\right)^{-5/2} \left(\frac{\beta'}{\beta_0}\right)^2 R - \frac{1}{2} \left(\frac{\beta}{\beta_0}\right)^{-3/2} \left(\frac{\beta'}{\beta}\right) \quad (26)$$

$$R'' + \frac{3}{4} \left(\frac{\beta'}{\beta}\right)^2 R - \frac{1}{2} \frac{\beta}{\beta_0} \frac{Q}{R} = 0.$$

(27)

Approximate potential as $\phi(r, z) = \phi_0 \cos(\pi z/L)$. From conservation of energy:

$$\Delta \left(\frac{1}{2} m v^2 \right) = -\Delta \left(\frac{q\phi}{m} \right) \quad (28)$$

$$\frac{1}{2} m (v^2 - v_0^2) = -q\phi_0 \cos \left(\frac{\pi z}{L} \right) \quad (29)$$

$$v^2 = v_0^2 - \frac{2q\phi_0}{m} \cos \left(\frac{\pi z}{L} \right) \quad (30)$$

Use this to rewrite $(\beta'/\beta)^2$:

$$v' = \frac{q\phi_0}{mv} \left(\frac{\pi}{L} \right) \sin \left(\frac{\pi z}{L} \right) \quad (31)$$

$$\frac{v'}{v} = \frac{q\phi_0}{mv^2} \left(\frac{\pi}{L} \right) \sin \left(\frac{\pi z}{L} \right) \quad (32)$$

$$\left(\frac{\beta'}{\beta} \right)^2 = \left(\frac{q\phi_0}{mv} \right)^2 \left(\frac{\pi}{L} \right)^2 \sin^2 \left(\frac{\pi z}{L} \right) \quad (33)$$

Assume $v_0^2 \gg \frac{2q\phi_0}{m}$, so that $v \approx v_0$.

$$\left(\frac{\beta'}{\beta}\right)^2 \approx \left(\frac{q\phi_0}{mv_0}\right)^2 \left(\frac{\pi}{L}\right)^2 \sin^2\left(\frac{\pi z}{L}\right) \quad (34)$$

For equilibrium ($R'' = R' = 0$), look at averages over z :

$$\overline{\left(\frac{\beta'}{\beta}\right)^2} = \frac{1}{2} \left(\frac{q\phi_0}{mv_0}\right)^2 \left(\frac{\pi}{L}\right)^2 \quad (35)$$

$$\overline{\left(\frac{\beta}{\beta_0}\right)} = 0 \quad (36)$$

$$\overline{R} = \overline{\left(\frac{\beta}{\beta_0}\right)^{1/2}} \tilde{r} = \tilde{r} \quad (37)$$

Inserting these terms in the envelope equation with $R'' = 0$ gives the maximum beam perveance:

$$\boxed{Q_{max} = \frac{3\pi^2}{4} \left(\frac{q\phi_0}{m\beta_0^2 c^2}\right)^2 \left(\frac{\tilde{r}}{L}\right)^2} \quad (38)$$

2.1 RMS envelope equations

$$\tilde{x}'' + \frac{(\gamma\beta)'}{(\gamma\beta)}\tilde{x}' + \kappa_x(s)\tilde{x} - \frac{\varepsilon_x^2}{\tilde{x}^3} - \frac{Q}{2(\tilde{x} + \tilde{y})} = 0 \quad (39)$$

$$\tilde{y}'' + \frac{(\gamma\beta)'}{(\gamma\beta)}\tilde{y}' + \kappa_y(s)\tilde{y} - \frac{\varepsilon_y^2}{\tilde{y}^3} - \frac{Q}{2(\tilde{x} + \tilde{y})} = 0 \quad (40)$$

$$Q = \frac{q\lambda}{2\pi\epsilon_0 mc^2 \beta^2 \gamma^3} \quad (41)$$

$$\varepsilon_x(s) = \sqrt{\langle xx \rangle \langle x'x' \rangle - \langle xx' \rangle \langle xx' \rangle} \quad (42)$$

$$\varepsilon_y(s) = \sqrt{\langle yy \rangle \langle y'y' \rangle - \langle yy' \rangle \langle yy' \rangle} \quad (43)$$

$$\kappa_x(s) = + \frac{qG}{\gamma\beta mc} \quad (44)$$

$$\kappa_y(s) = - \frac{qG}{\gamma\beta mc} \quad (45)$$

Let $\kappa_x(s) = f(s)\kappa_0$ and $\kappa_y(s) = -\kappa_x(s)$. Ignoring acceleration ($\ddot{x} = 0$):

$$\tilde{x}'' + \kappa_0 f(s) \tilde{x} - \frac{\varepsilon_x^2}{\tilde{x}^3} - \frac{Q}{2(\tilde{x} + \tilde{y})} = 0 \quad (46)$$

$$\tilde{y}'' - \kappa_0 f(s) \tilde{y} - \frac{\varepsilon_y^2}{\tilde{y}^3} - \frac{Q}{2(\tilde{x} + \tilde{y})} = 0 \quad (47)$$

$\eta = \text{Occupancy} \in (0, 1]$

$$f(s) = \begin{cases} +1 & \text{if } 0 \leq s/L < \eta/2 \\ -1 & \text{if } 1 - \eta/2 \leq s/L < 1 + \eta/2 \\ +1 & \text{if } 2 - \eta/2 \leq s/L < 2 \end{cases} \quad (48)$$

To derive the maximum beam current, approximate $f(s)$, $\tilde{x}(s)$, and $\tilde{y}(s)$ as sinusoidal functions at the lattice frequency. Then plug into envelope equation, ignore fast-oscillating terms, and solve for equilibrium.

Start with the focusing strength $f(s)$:

$$f(s) = \sum_{n=1}^{\infty} a_n \cos\left(\frac{n\pi s}{L}\right) \quad (49)$$

$$a_n = \frac{1}{L} \int_0^{2L} f(s) \cos\left(\frac{n\pi s}{L}\right) ds \quad (50)$$

$$f(s) \approx a_1 \cos\left(\frac{\pi s}{L}\right) = \frac{4}{\pi} \sin\left(\frac{\pi\eta}{2}\right) \cos\left(\frac{\pi s}{L}\right)$$

(51)

Approximate rms envelope evolution as:

$$\tilde{x}(s) = \frac{\tilde{r}_0}{\sqrt{2}} \left[1 + \delta \cos \left(\frac{\pi s}{L} \right) \right] \quad (52)$$

$$\tilde{y}(s) = \frac{\tilde{r}_0}{\sqrt{2}} \left[1 - \delta \cos \left(\frac{\pi s}{L} \right) \right] \quad (53)$$

Now evaluate terms in rms envelope equations: $\tilde{x}''$, $f(s)\tilde{x}$, etc.

$$\tilde{x}'' = -\frac{\tilde{r}_0}{\sqrt{2}} \delta \frac{\pi^2}{L^2} \cos \left(\frac{\pi s}{L} \right) \quad (54)$$

$$\tilde{y}'' = +\frac{\tilde{r}_0}{\sqrt{2}} \delta \frac{\pi^2}{L^2} \cos \left(\frac{\pi s}{L} \right) \quad (55)$$

$$f(s)\tilde{x}(s) = \frac{4\tilde{r}_0}{\sqrt{2}\pi} \sin\left(\frac{\pi\eta}{2}\right) \cos\left(\frac{\pi s}{L}\right) \left[1 + \delta \cos\left(\frac{\pi s}{L}\right)\right], \quad (56)$$

$$= \frac{4\tilde{r}_0}{\sqrt{2}\pi} \sin\left(\frac{\pi\eta}{2}\right) \left[\cos\left(\frac{\pi s}{L}\right) + \delta \cos^2\left(\frac{\pi s}{L}\right)\right]. \quad (57)$$

Ignore fast oscillating component of $\cos^2(\pi s/L)$:

$$\cos^2\left(\frac{\pi s}{L}\right) = \frac{1}{2} + \frac{1}{2} \cos\left(\frac{2\pi s}{L}\right) \approx \frac{1}{2}. \quad (58)$$

This gives:

$$f(s)\tilde{x}(s) \approx \frac{4\tilde{r}_0}{\sqrt{2}\pi} \sin\left(\frac{\pi\eta}{2}\right) \left[\cos\left(\frac{\pi s}{L}\right) + \frac{\delta}{2}\right], \quad (59)$$

$$f(s)\tilde{y}(s) \approx \frac{4\tilde{r}_0}{\sqrt{2}\pi} \sin\left(\frac{\pi\eta}{2}\right) \left[\cos\left(\frac{\pi s}{L}\right) - \frac{\delta}{2}\right]. \quad (60)$$

Plugging these approximations into rms envelope equations:

$$-\left[\delta \frac{\pi^2}{L^2} - \frac{4\kappa_0}{\pi} \sin\left(\frac{\eta\pi}{2}\right)\right] \cos\left(\frac{\pi s}{L}\right) + \frac{2\kappa_0\delta}{\pi} \sin\left(\frac{\eta\pi}{2}\right) = \frac{Q}{2\tilde{r}_0^2}, \quad (61)$$

$$+\left[\delta \frac{\pi^2}{L^2} - \frac{4\kappa_0}{\pi} \sin\left(\frac{\eta\pi}{2}\right)\right] \cos\left(\frac{\pi s}{L}\right) + \frac{2\kappa_0\delta}{\pi} \sin\left(\frac{\eta\pi}{2}\right) = \frac{Q}{2\tilde{r}_0^2}. \quad (62)$$

Solve for δ and Q :

$$\delta = \frac{4\kappa_0 L^2}{\pi^3} \sin\left(\frac{\eta\pi}{2}\right) \quad (63)$$

$$Q = \frac{4\kappa_0\delta}{\pi} \sin\left(\frac{\eta\pi}{2}\right) \tilde{r}_0^2 \quad (64)$$

$$\boxed{Q_{max} \approx \frac{2\kappa_0 L \eta}{\pi} \left[\frac{\sin(\eta\pi/2)}{(\eta\pi/2)} \right]^2 \tilde{r}_0^2} \quad (65)$$

2.2 Continuous focusing
